

Major AI Agent Frameworks & Tools

1. LangChain

What It Is: The most popular framework for building LLM applications and agents.
Best For: Rapid prototyping, extensive integrations, large community support.

Key Features:

- Pre-built agent types (ReAct, Plan-and-Execute, etc.)
- 200+ tool integrations for every kind of LLM model openai ,antropic
- Memory management systems
- Chain orchestration

Limitations: Can be complex for simple use cases, abstraction overhead.

2.LangGraph

LangChain extension for stateful multi-agent workflows using graph-based orchestration, best for production deployments needing flow control.

Limitations: Steeper learning curve than basic LangChain.

3.CrewAI

Role-based multi-agent framework built on LangChain, best for business workflows with structured task delegation

Limitations: Less flexible than raw LangChain for custom architectures.

4.N8n:

low code platform,drag and drop create entire workflow.aslo allow multiple integration

Difference: It is a visual workflow builder.

5.ANGO:

Provide fastest way to create agent

AGNO excels at rapid agent development with minimal setup. It works well for developers wanting clean, simple APIs. It suits projects prioritizing speed over extensive features. It is ideal for startups and small teams building agent applications quickl

Key Providers

- OpenAI: Known for being very smart and reliable for almost any task.
- Anthropic: It is known for being safe and writing in a human-like way.
- Google: It is fast and can handle large amounts of information.
- Meta: Llama 3 open-weight models, best for self-hosting, data privacy, and full infrastructure control.

Common Architectures

- **Single Agent:** One agent handles all tasks, best for simple workflows and quick deployment.
- **Multi-Agent:** Multiple specialized agents collaborate, best for complex tasks requiring diverse capabilities.
- **Tool-Use:** Agents equipped with external APIs and functions, best for real-world actions and system integration.
- **Memory:** Agents with short-term and long-term storage, best for personalization and context retention.
- **RAG:** Retrieval-augmented generation with data lookup, best for knowledge-heavy and domain-specific tasks.
